Sticky Buns and Scholarship

Pamela Stewart Fahs, PhD, RN, Editor

Imagine the scene, it is a cold December day yet the inside is cozy, with a roaring fire and large covered bowels of dough beside the hearth. The smell of yeast dough permeates the house. “Sticky Buns”, an old family recipe from the Appalachian Mountains in southeastern KY, for homemade cinnamon buns with a decadent caramel and nut topping, are being prepared for the holidays. Not the scene usually associated with scholarship yet a professor and doctoral students are working on an abstract for submission to a rural nursing research conference. Sister Arminger (1974, p. 160) said “life experiences, all of them, make the scholar”. The socialization of a scholar has traditionally taken place in a male dominated academy. The manner of socialization to scholarship may vary by discipline and place and yes even primary gender within the area of science.

The purpose of academia and thus the faculty within the system is to create and disseminate knowledge. Research is a strong component in the creation of knowledge and critical to dissemination are the components of teaching and scholarship. The method of dissemination can vary significantly by discipline and is of course in transition as our technology changes. Whether it is in a typical classroom, authoring a book, journal article, presentation, webinar. poster, or dissemination of knowledge in clinical practice we can and should take opportunities to socialize our nurse scientists to participate in both research and scholarship.

The abstract (Pribulick, Quaranta, Srnka-Debnar, & Daws, 2009) prepared in this seemingly incongruent setting emerged from a piece of research that was conceived in the classroom, carried out in rural communities and was disseminated at a national conference
focused on rural nursing and health. Busy schedules and creative planning allowed this project to come to fruition. This may not have been what Sister Arminger had in mind but it was certainly a unique life experience that did help build scholars in rural nursing science and one that could be viewed as fitting given the students were completing their doctoral work in a program focused on rural nursing.

The 2016 International Rural Nursing Conference is going to be held in Rapid City South Dakota, July 19 -21, 2016. Whether you are a clinician, educator, or student; conducting research, providing care, or working on health policy this conference is one you should explore. Abstracts are being accepted until February 1, 2016 at www.mhch.org/international-rural-nursing-conference-abstract-submission. Bring your scholarship to this upcoming conference as part of your life experience.
